## INTERPOLATION

### 3.1 Introduction:

Let  $f(x)$  be a function of  $x$  defined in the interval  $I: (-\infty < x < \infty)$  in which it is assumed to be continuous and continuously differentiable for a sufficient number of times. Suppose the analytical formula for the function  $y = f(x)$  is not known, but the values of  $f(x)$  are known for  $(n+1)$  distinct values of  $x$ , say  $x_0, x_1, \dots, x_n$ , called *arguments of nodes* which are entered as  $y_0 = f(x_0), y_1 = f(x_1), \dots, y_n = f(x_n)$  and there is no other information available about the function. Our problem is to compute the value of  $f(x)$ , at least approximately, for a given arguments  $x$  in the vicinity of the above given values of the arguments. The process by which we can find the value of  $f(x)$  for any other value of  $x$  in the interval  $[x_0, x_1]$  is called *interpolation*. When  $x$  lies slightly outside the interval  $[x_0, x_n]$ , then the process is called *extrapolation*.

[W.B.U.T., CS-312, 2006, 2008, 2009,

M.A.K.A.U.T., 2013, 2015]

Since the analytical form i.e., explicit nature of  $f(x)$  is not known, it is required to find a simpler function, say  $p(x)$ , such that

$$p(x_i) = f(x_i), \quad i = 0, 1, 2, \dots, n \quad \dots \quad (1)$$

This function  $p(x)$  is known as *interpolating function* and in general

$$f(x) \approx p(x) \quad \dots \quad (2)$$

If  $p(x)$  is a polynomial, then the process is called *polynomial interpolation* and  $p(x)$  is called the *interpolating polynomial*. The justification of replacing a function by a polynomial rests on a theorem due to Weierstrass and is stated below without proof.

**Theorem.** Let  $f(x)$  be a function defined and continuous on  $a \leq x \leq b$ . Then for  $\epsilon > 0$ , there exist a polynomial  $p(x)$  such that

$$|f(x) - p(x)| < \epsilon, \quad a \leq x \leq b$$

### 3.2. Error or remainder in polynomial interpolation

In virtue of (2), if we write

$$f(x) = p(x) + E(x) \quad \dots \quad (3)$$

then  $E(x)$  is the error committed in replacing  $f(x)$  by  $p(x)$ .

Using (1), we have

$$E(x_i) = 0, \quad i = 0, 1, 2, \dots, n \quad \dots \quad (4)$$

$$\text{By virtue of (4), let us assume } E(x) = k(x)\psi(x) \quad \dots \quad (5)$$

$$\text{where } \psi(x) = (x - x_0)(x - x_1) \dots (x - x_n) \quad \dots \quad (6)$$

and  $k(x)$  is to be determined such that (5) holds for any intermediate value of  $x$ , say  $x = \alpha$ , which is different from  $x_i (i = 0, 1, 2, \dots, n)$

$$\text{Hence } k(\alpha) = \frac{E(\alpha)}{\psi(\alpha)} = \frac{f(\alpha) - p(\alpha)}{\psi(\alpha)}, \text{ by (3)} \quad \dots \quad (7)$$

Let us construct a function  $F(x)$  such that

$$F(x) = f(x) - p(x) - k(\alpha)\psi(x) \quad \dots \quad (8)$$

Then  $F(x_i) = 0, i = 0, 1, 2, \dots, n$ , by (1) and (6)

$$\text{Also } F(\alpha) = 0, \text{ by (7)} \quad \dots \quad (9)$$

Hence  $F(x)$  vanishes at  $(n+2)$  number of points in the interval I. Then by repeated application of Rolle's theorem, we have

$$F^{n+1}(\xi) = 0 \text{ where } \xi \in I \quad \dots \quad (10)$$

Since  $p(x)$  is a polynomial of degree not greater than  $n$ , so we must have

$$p^{n+1}(x) = 0 \quad \dots \quad (11)$$

Also, from (6), we have

$$\psi^{n+1}(x) = (n+1)! \quad \dots \quad (12)$$

### INTERPOLATION

$\therefore$  Hence (8)

$$F^{n+1}(x) =$$

$$\text{or, } f^{n+1}(\xi) - ($$

$$\therefore k(\alpha) = \frac{f^{n+1}(\alpha)}{(n+1)!}$$

$\therefore$  From (7),

$$E(\alpha) =$$

Since  $\alpha$  is an

$$E(x) = \frac{f^{n+1}(\alpha)}{(n+1)!}$$

$$= \frac{f^{n+1}(\alpha)}{(n+1)!}$$

This expresses

### 3.3. Newton's

Let  $y = f(x)$  be a function defined over the interval  $[a, b]$  and its values are known for  $x_i (i = 0, 1, 2, \dots, n)$  with  $x_0 = a, x_n = b$ . Construct a polynomial  $p(x)$  of degree  $n$  such that

$$p(x_i) = f(x_i)$$

Since  $p(x)$  is a polynomial of degree  $n$ , we must have

$$p(x) = a_0$$

where the coefficients  $a_0, a_1, \dots, a_n$  are to be determined by the condition

$\therefore$  Hence (8) gives

$$F^{n+1}(x) = f^{n+1}(x) - 0 - (n+1)! k(\alpha)$$

or,  $f^{n+1}(\xi) - (n+1)! k(\alpha) = 0$ , by (10)

$$\therefore k(\alpha) = \frac{f^{n+1}(\xi)}{(n+1)!} \quad \dots \quad (13)$$

$\therefore$  From (7),

$$E(\alpha) = \frac{f^{n+1}(\xi)}{(n+1)!} \psi(\alpha)$$

Since  $\alpha$  is an arbitrary value of  $x$ , so

$$\begin{aligned} E(x) &= \frac{f^{n+1}(\xi)}{(n+1)!} \psi(x) \\ &= \frac{f^{n+1}(\xi)}{(n+1)!} (x - x_0)(x - x_1) \dots (x - x_n), \quad \xi \in I \quad (14) \end{aligned}$$

This expression gives the error in polynomial interpolation

### 3.3. Newton's forward interpolation formula.

[W.B.U.T., CS-312, 2002, 2006, 2013]

Let  $y = f(x)$  be a real valued function of  $x$  defined in an interval  $[a, b]$  and the  $(n+1)$  entries  $y_i = f(x_i)$  ( $i = 0, 1, 2, \dots, n$ ) are known for the corresponding  $(n+1)$  equispaced arguments  $x_i$  ( $i = 0, 1, 2, \dots, n$ ) such that  $x_i = x_0 + ih$  ( $i = 0, 1, 2, \dots, n$ ) with  $x_0 = a$ ,  $x_n = b$  and  $h$  is the space length. Let us now construct a polynomial function  $p(x)$  of degree not greater than  $n$  such that

$$p(x_i) = f(x_i) = y_i \quad (i = 0, 1, 2, \dots, n) \quad \dots \quad (15)$$

Since  $p(x)$  is a polynomial of degree  $\leq n$ , so we assume  $p(x)$  as

$$\begin{aligned} p(x) &= a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) \\ &\quad + \dots + a_n(x - x_0)(x - x_1) \dots (x - x_{n-1}) \quad \dots \quad (16) \end{aligned}$$

where the coefficients  $a_0, a_1, a_2, \dots, a_n$  are constants to be determined by (15).

Substituting  $x = x_0, x_1, x_2, \dots, x_n$  successively in (16) and using (15) we obtain

$$p(x_0) = a_0$$

$$\text{i.e., } a_0 = y_0,$$

$$p(x_1) = a_0 + a_1(x_1 - x_0)$$

$$\text{i.e., } y_1 = y_0 + a_1 \cdot h$$

$$\therefore a_1 = \frac{y_1 - y_0}{h} = \frac{\Delta y_0}{1!h}$$

$$p(x_2) = a_0 + a_1(x_2 - x_0) + a_2(x_2 - x_0)(x_2 - x_1)$$

$$\text{or, } y_2 = y_0 + \frac{y_1 - y_0}{h} \cdot 2h + a_2 \cdot 2h \cdot h$$

$$\text{or, } a_2 = \frac{y_2 - 2y_1 + y_0}{2h^2} = \frac{\Delta^2 y_0}{2!h^2}$$

Similarly, we get

$$a_3 = \frac{\Delta^3 y_0}{3!h^3}, \dots, a_n = \frac{\Delta^n y_0}{n!h^n}$$

Substituting the above values of  $a_i$ 's ( $i = 0, 1, 2, \dots, n$ ) in (16) we obtain

$$p(x) = y_0 + \frac{\Delta y_0}{h}(x - x_0) + \frac{\Delta^2 y_0}{2!h^2}(x - x_0)(x - x_1) \\ + \dots + \frac{\Delta^n y_0}{n!h^n}(x - x_0)(x - x_1)\dots(x - x_{n-1}) \dots \quad (17)$$

On introducing the phase  $s = \frac{x - x_0}{h}$  and noting that  $x - x_r = (x_0 + sh) - (x_0 + rh) = (s - r)h, r = 0, 1, 2, \dots, n - 1$  (18) we get

$$f(x) \approx p(x) = y_0 + s\Delta y_0 + \frac{s(s-1)}{2!} \Delta^2 y_0 \\ + \dots + \frac{s(s-1)\dots(s-n+1)}{n!} \Delta^n y_0 \dots \quad (19)$$

## INTERPOLATION

The formula (17) is called interpolation formula.

Newton's forward or error term  $E(x)$

$$f(x) = p(x) +$$

$$= y_0 + s$$

$$+ \frac{s(s-1)}{2!} \Delta^2 y_0 + \dots$$

where the remain-

$$E(x) = (x - x_0)$$

$$= s(s-1)(s-2)\dots$$

$$\min\{x, x_0\}$$

**Note. (i)** The points are equi-

**(ii)** The form the beginning values of y with

**(iii)** For b-

$$s = \frac{x - x_0}{h}$$

**Example.** For forward inte-

$x$
$y = f(x)$

The formula (17) or (19) is known as *Newton's forward interpolation formula*.

Newton's forward interpolation formula with the remainder or error term  $E(x)$  can be written as

$$\begin{aligned} f(x) &= p(x) + E(x) \\ &= y_0 + s\Delta y_0 + \frac{s(s-1)}{2!} \Delta^2 y_0 + \dots + \\ &\quad + \frac{s(s-1)(s-2)\dots(s-n+1)}{n!} \Delta^n y_0 + E(x), \quad \dots \end{aligned} \quad (20)$$

where the remainder or error is given by

$$\begin{aligned} E(x) &= (x - x_0)(x - x_1)\dots(x - x_n) \frac{f^{n+1}(\xi)}{(n+1)!} \\ &= s(s-1)(s-2)\dots(s-n) \frac{h^{n+1} f^{n+1}(\xi)}{(n+1)!}, \quad \dots \end{aligned} \quad (21)$$

$\min\{x, x_0, x_1, \dots, x_n\} < \xi < \max\{x, x_0, x_1, x_2, \dots, x_n\}$

**Note.** (i) This formula is used only when the interpolating points are equally spaced.

(ii) The formula is used for interpolating the value of  $y$  near the beginning of the set of arguments and for extrapolating the values of  $y$  within a short distance backward to the left of  $y_0$ .

(iii) For better accuracy,  $x_0$  should be chosen such that

$$s = \frac{x - x_0}{h} \text{ is as small as possible.}$$

**Example.** From the following table, find  $f(0.16)$  using Newton's forward interpolation formula :

$x$	:	0.1	0.2	0.3	0.4
$y = f(x)$	:	1.005	1.020	1.045	1.081

**Solution.** The difference table is

$x$	$y$	$\Delta y$	$\Delta^2 y$	$\Delta^3 y$
0.1	1.005		0.015	
0.2	1.020		0.025	0.010
0.3	1.045			0.001
0.4	1.081		0.036	0.011

To find  $f(0.16)$ , we put  $x = 0.16$ ,  $x_0 = 0.2$ ,  $h = 0.1$

so that

$$s = \frac{x - x_0}{h} = \frac{0.16 - 0.2}{0.1} = -0.4$$

Then using (19), we get

$$\begin{aligned} f(0.16) &\approx y_0 + s \Delta y_0 + \frac{s(s-1)}{2!} \Delta^2 y_0 + \dots \\ &= 1.020 + (-0.4) \times 0.025 + \frac{(-0.4)(-0.4-1)}{2!} \times 0.011 \\ &= 1.01308 \end{aligned}$$

$\therefore f(0.16) \approx 1.013$ , correct upto three decimal places.

### 3.4. Newton's backward interpolation formula.

[W.B.U.T., M(CS)-401, 2013]

Let the values of the function  $f(x)$  be given for the corresponding  $(n+1)$  equispaced arguments  $x_i$  ( $i = 0, 1, 2, \dots, n$ ), the step length being  $h$ , such that  $x_i = x_0 + ih$  ( $i = 0, 1, 2, \dots, n$ ) and  $y_i = f(x_i)$  ( $i = 0, 1, 2, \dots, n$ )

$$\begin{aligned} \text{Then } x_{n-i} - x_n &= x_0 + (n-i)h - x_0 - nh \\ &= -ih \quad (i = 0, 1, 2, \dots, n). \end{aligned}$$

Now we consider a polynomial  $p(x)$  of degree  $\leq n$  which replaces  $f(x)$  at the interpolating points  $x_i$  ( $i = 0, 1, 2, \dots, n$ ), i.e.,

$$p(x_i) = f(x_i) = y_i \quad (i = 0, 1, 2, \dots, n) \quad \dots \quad (22)$$

Since  $p(x)$  is a polynomial of degree  $\leq n$ , we take

$$\begin{aligned} p(x) &= a_0 + a_1(x - x_n) + a_2(x - x_n)(x - x_{n-1}) + \dots \\ &\quad + a_n(x - x_n)(x - x_{n-1}) \dots (x - x_1) \quad \dots \quad (23) \end{aligned}$$

where the coefficient  $a_0, a_1, a_2, \dots, a_n$  are constants to be determined by (22)

Substituting  $x = x_n$  using (22), we obtain  
 $p(x_n) = a_0$   
i.e.,  $a_0 = y_n$ ,  
 $p(x_{n-1}) = a_0 + a_1$   
i.e.,  $y_{n-1} = y_n + a_1$   
 $\therefore a_1 = \frac{y_n - y_{n-1}}{h}$   
 $p(x_{n-2}) = a_0 + a_1 + a_2$   
i.e.,  $y_{n-2} = y_n + a_1 + a_2$   
leading to  
 $a_2 = \frac{y_n - 2y_{n-1} + y_{n-2}}{2h}$

Proceeding in the

$$a_3 = \frac{\nabla^3 y_n}{3!}$$

Substituting the  
we obtain  
 $p(x) = y_n + \frac{\nabla y_n}{1!} (x - x_n) + \dots + \frac{\nabla^3 y_n}{3!} (x - x_n)^3$

On introduction

$$s + r = \frac{x - x_{n-r}}{h}$$

$$f(x) \approx p(x) = y_n$$

which is known

Newton's back  
or error term  $E(x)$

$$\begin{aligned} f(x) &= p(x) + \\ &= y_n + s \nabla y_n + \dots + \frac{s(s-1)\dots(s-n+1)}{n!} y_n \end{aligned}$$

Substituting  $x = x_n, x_{n-1}, x_{n-2}, \dots, x_0$  successively in (23) and using (22), we obtain

$$p(x_n) = a_0$$

i.e.,  $a_0 = y_n$ ,

$$p(x_{n-1}) = a_0 + a_1(x_{n-1} - x_n)$$

i.e.,  $y_{n-1} = y_n + a_1(-h)$

$$\therefore a_1 = \frac{y_n - y_{n-1}}{h} = \frac{\nabla y_n}{h},$$

$$p(x_{n-2}) = a_0 + a_1(x_{n-2} - x_n) + a_2(x_{n-2} - x_n)(x_{n-2} - x_{n-1})$$

$$\text{i.e., } y_{n-2} = y_n + a_1(-2h) + a_2(-2h)(-h)$$

leading to

$$a_2 = \frac{y_n - 2y_{n-1} + y_{n-2}}{2h^2} = \frac{\nabla^2 y_n}{2!h^2}$$

Proceeding in this way, we get

$$a_3 = \frac{\nabla^3 y_n}{3!h^3}, \dots, a_n = \frac{\nabla^n y_n}{n!h^n}$$

Substituting the above values of  $a_i$ 's ( $i = 0, 1, 2, \dots, n$ ) in (23) we obtain

$$p(x) = y_n + \frac{\nabla y_n}{1!h}(x - x_n) + \frac{\nabla^2 y_n}{2!h^2}(x - x_n)(x - x_{n-1}) \\ + \dots + \frac{(x - x_n)(x - x_{n-1})\dots(x - x_1)}{n!h^n} \nabla^n y_n \quad \dots \quad (24)$$

On introduction of the phase  $s = \frac{x - x_n}{h}$  so that

$$s + r = \frac{x - x_{n-r}}{h} \quad (r = 0, 1, 2, \dots, n) \text{ in (24) gives}$$

$$f(x) \approx p(x) = y_n + s \nabla y_n + \frac{s(s+1)}{2!} \nabla^2 y_n + \dots \\ + \frac{s(s+1)(s+2)\dots(s+n-1)}{n!} \nabla^n y_n \quad \dots \quad (25)$$

which is known as *Newton's backward interpolation formula*.

Newton's backward interpolation formula with remainder or error term  $E(x)$  can be written as

$$f(x) = p(x) + E(x) \\ = y_n + s \nabla y_n + \frac{s(s+1)}{2!} \nabla^2 y_n + \dots \\ + \frac{s(s+1)(s+2)\dots(s+n-1)}{n!} \nabla^n y_n + E(x) \quad \dots \quad (26)$$

where the remainder or error is given by

$$E(x) = (x - x_n)(x - x_{n-1}) \dots (x - x_1)(x - x_0) \frac{f^{n+1}(\xi)}{(n+1)!}$$

$$= s(s+1) \dots (s+n) h^{n+1} \frac{f^{n+1}(\xi)}{(n+1)!}, \quad \dots \quad (27)$$

$$\min\{x, x_0, x_1, \dots, x_n\} < \xi < \max\{x, x_0, x_1, \dots, x_n\}$$

Note. (i) The formula is used only when interpolating points are equally spaced.

(ii) The formula is used for interpolating the value of  $y$  near the end of the given set of arguments and for extrapolating the value of  $y$  within a short distance forward to the right of  $x_n$ .

(iii) For better accuracy  $x_n$  should be chosen such that

$$s = \frac{x - x_n}{h}$$
 is as small as possible.

**Example.** Find  $f(2.28)$  from the following table :

$x$	2.00	2.10	2.20	2.30
$y = f(x)$	1.7314	1.7811	1.8219	1.8535

**Solution.** The difference table is

$x$	$y$	$\Delta y$	$\Delta^2 y$	$\Delta^3 y$
2.00	1.7314			
2.10	1.7811	0.0497	-0.0089	
2.20	1.8219	0.0408	-0.0092	-0.0003
2.30	1.8535	0.0316		

To find  $f(2.28)$ , we put  $x = 2.28$ ,  $x_n = 2.30$ ,  $h = 0.10$ , so that

$$s = \frac{x - x_n}{h} = -0.2$$

Hence using (25) we obtain

$$f(2.28) \approx y_n + s \nabla y_n + \frac{s(s+1)}{2!} \nabla^2 y_n + \dots$$

$$= 1.8535 + (-0.2) \times 0.0316 + \frac{(-0.2)(-0.2+1)}{2!} \times (-0.0092)$$

$$+ \frac{(-0.2)(-0.2+1)(-0.2+2)}{3!} \times (-0.0003)$$

$$= 1.8464504$$

$\therefore f(2.28) \approx 1.8464$ , correct upto four decimal places.

## INTERPOLATION

### 3.5. Lagrange's

Let  $y = f(x)$  be continuously differentiable in  $[a, b]$  by  $(n+1)$  times necessarily equated to  $y_i = f(x_i)$  ( $i = 0, 1, 2, \dots, n$ ) at  $L_n(x)$  in  $x$  of degree  $n$ .

$$\text{Since } L_n(x) \text{ is a polynomial of degree } n, \\ L_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \dots + a_n(x - x_0)(x - x_1)(x - x_2) \dots (x - x_{n-1})$$

where the coefficients  $a_0, a_1, \dots, a_n$  are given by (28).

Putting  $x = x_0$  in (28), we get

$$L_n(x_0) = a_0 + a_1(x_0 - x_0) + a_2(x_0 - x_0)(x_0 - x_1) + \dots + a_n(x_0 - x_0)(x_0 - x_1)(x_0 - x_2) \dots (x_0 - x_{n-1})$$

$$\therefore a_0 = L_n(x_0)$$

Now putting  $x = x_1$  in (28), we get

$$L_n(x_1) = a_0 + a_1(x_1 - x_0) + a_2(x_1 - x_0)(x_1 - x_1) + \dots + a_n(x_1 - x_0)(x_1 - x_1)(x_1 - x_2) \dots (x_1 - x_{n-1})$$

$$\therefore a_1 = \frac{L_n(x_1) - a_0}{(x_1 - x_0)}$$

Proceeding in this way, we get

$$\therefore a_n = \frac{L_n(x_n) - a_0 - a_1(x_n - x_0) - a_2(x_n - x_0)(x_n - x_1) - \dots - a_{n-1}(x_n - x_0)(x_n - x_1)(x_n - x_2) \dots (x_n - x_{n-2})}{(x_n - x_0)(x_n - x_1)(x_n - x_2) \dots (x_n - x_{n-1})}$$

Substituting the values of  $a_0, a_1, \dots, a_n$  in (28), we obtain

$$L_n(x) = \frac{(x - x_0)(x - x_1)(x - x_2) \dots (x - x_{n-1})(x - x_n)}{(x_n - x_0)(x_n - x_1)(x_n - x_2) \dots (x_n - x_{n-1})} y_n$$

$$+ \frac{(x - x_0)(x - x_1)(x - x_2) \dots (x - x_{n-1})}{(x_1 - x_0)(x_1 - x_2) \dots (x_1 - x_{n-1})} a_1$$

$$+ \frac{(x - x_0)(x - x_1)(x - x_2) \dots (x - x_{n-2})}{(x_2 - x_0)(x_2 - x_1) \dots (x_2 - x_{n-2})} a_2$$

$$+ \frac{(x - x_0)(x - x_1)(x - x_2) \dots (x - x_{n-3})}{(x_3 - x_0)(x_3 - x_1) \dots (x_3 - x_{n-3})} a_3$$

$$+ \dots + \frac{(x - x_0)(x - x_1)(x - x_2) \dots (x - x_{n-1})}{(x_{n-1} - x_0)(x_{n-1} - x_1) \dots (x_{n-1} - x_{n-2})} a_{n-1}$$

$$= \sum_{i=0}^{n-1} a_i \frac{(x - x_0)(x - x_1) \dots (x - x_i)}{(x_i - x_0)(x_i - x_1) \dots (x_i - x_{i-1})}$$

### 3.5. Lagrange's interpolation formula.

Let  $y = f(x)$  be a function of  $x$ , continuous and  $(n+1)$  times continuously differentiable in  $[a, b]$ . Let us divide the interval  $[a, b]$  by  $(n+1)$  points  $a = x_0, x_1, \dots, x_n = b$  which are not necessarily equispaced and the corresponding entries are  $y_i = f(x_i)$  ( $i = 0, 1, 2, \dots, n$ ). We now wish to find a polynomial  $L_n(x)$  in  $x$  of degree  $n$  such that

$$L_n(x_i) = f(x_i) = y_i \quad (i = 0, 1, 2, \dots, n) \quad \dots \quad (28)$$

Since  $L_n(x)$  is a polynomial of degree  $n$ , so we may take  $L_n(x)$  as

$$\begin{aligned} L_n(x) &= a_0(x - x_1)(x - x_2)\dots(x - x_n) + \\ &\quad a_1(x - x_0)(x - x_2)\dots(x - x_n) + \dots \\ &\quad + a_n(x - x_0)(x - x_1)\dots(x - x_{n-1}) \end{aligned} \quad \dots \quad (29)$$

where the coefficients  $a_0, a_1, \dots, a_n$  are constants to be determined by (28).

Putting  $x = x_0$  in (29) and using (28), we get

$$\begin{aligned} L_n(x_0) &= a_0(x_0 - x_1)(x_0 - x_2)\dots(x_0 - x_n) \\ \therefore a_0 &= \frac{y_0}{(x_0 - x_1)(x_0 - x_2)\dots(x_0 - x_n)} \end{aligned}$$

Now putting  $x = x_1$  in (29) and using (28), we get

$$\begin{aligned} L_n(x_1) &= a_1(x_1 - x_0)(x_1 - x_2)\dots(x_1 - x_n) \\ \therefore a_1 &= \frac{y_1}{(x_1 - x_0)(x_1 - x_2)\dots(x_1 - x_n)} \end{aligned}$$

Proceeding in the same way, we have

$$\therefore a_n = \frac{y_n}{(x_n - x_0)(x_n - x_1)\dots(x_n - x_{n-1})}$$

Substituting the above values of  $a_i$ 's ( $i = 0, 1, 2, \dots, n$ ) in (29), we obtain

$$\begin{aligned} L_n(x) &= \frac{(x - x_1)(x - x_2)\dots(x - x_n)}{(x_0 - x_1)(x_0 - x_2)\dots(x_0 - x_n)} y_0 \\ &\quad + \frac{(x - x_0)(x - x_2)\dots(x - x_n)}{(x_1 - x_0)(x_1 - x_2)\dots(x_1 - x_n)} y_1 + \dots \\ &\quad + \frac{(x - x_0)(x - x_1)\dots(x - x_{n-1})}{(x_n - x_0)(x_n - x_1)\dots(x_n - x_{n-1})} y_n \\ &= \sum_{i=0}^n l_i(x) y_i \end{aligned} \quad \dots \quad (30)$$

where

$$l_i(x) = \frac{(x - x_0)(x - x_1)\dots(x - x_{i-1})(x - x_{i+1})\dots(x - x_n)}{(x_i - x_0)(x_i - x_1)\dots(x_i - x_{i-1})(x_i - x_{i+1})\dots(x_i - x_n)} \quad (31)$$

is called the *Lagrangian function*.

Now let us set

$$P_{n+1}(x) = (x - x_0)(x - x_1)\dots(x - x_{i-1})(x - x_i)(x - x_{i+1})\dots(x - x_n)$$

so that

$$P'_{n+1}(x_i) = (x_i - x_0)(x_i - x_1)\dots(x_i - x_{i-1})(x_i - x_{i+1})\dots(x_i - x_n)$$

Thus we may write (31) in the form

$$l_i(x) = \frac{P_{n+1}(x)}{(x - x_i)P'_{n+1}(x_i)}$$

and therefore, from (30), we have

$$f(x) \approx L_n(x) = \sum_{i=0}^n \frac{P_{n+1}(x)}{(x - x_i)P'_{n+1}(x_i)} y_i \quad \dots \quad (32)$$

which is called *Lagrange's interpolation formula*.

The remainder or error in Lagrange's interpolation formula is given by

$$\begin{aligned} E(x) &= f(x) - L_n(x) \\ &= \frac{P_{n+1}(x)f^{n+1}(\xi)}{(n+1)!}, \end{aligned} \quad \dots \quad (33)$$

$$\min\{x, x_0, x_1, \dots, x_n\} < \xi < \max\{x, x_0, x_1, \dots, x_n\}$$

**Note.** (1) Some advantage of Lagrange's interpolation are given below :

(i) The formula is applicable to both equispaced and unequispaced interpolating points.

(ii) There is no restriction on the order of the interpolating points  $x_0, x_1, x_2, \dots, x_n$ .

(iii) The value of  $x$  corresponding to which the value of  $y = f(x)$  is to be determined may lie anywhere of the tabulated values i.e.,  $x$  may lie near the begining, end or middle of the tabulated values.

**Note.** (2) Some disadvantage of Lagrange's interpolation are given below :

(i) For increase of the degree of the interpolating polynomial by adding new interpolating point, the whole calculation would be made afresh.

(ii) The calculated values used are tal

**Example.** Find the points  $(-1, 1)$ , ( $1, 1$ )

**Solution.** Using I

$$\begin{aligned} L_n(x) &= \frac{(x - x_1)(x - x_2)}{(x_0 - x_1)(x_0 - x_2)} + \frac{(x - x_0)(x - x_2)}{(x_1 - x_0)(x_1 - x_2)} \\ &= \frac{(x - 0)(x - 1)}{(-1 - 0)(-1 - 1)} + \frac{(x + 1)(x - 1)}{(1 + 1)(1 - 1)} \\ &= \frac{1}{3}(-2x^3 + 3x^2 + 2x) \end{aligned}$$

Hence the requ

### 3.6. Newton's di

ing polynomial calculation would

(ii) The calculations provide no check whether the functional values used are taken correctly or not.

**Example.** Find the polynomial of degree  $\leq 3$  passing through the points  $(-1, 1)$ ,  $(0, 1)$ ,  $(1, 1)$  and  $(2, -3)$ .

**Solution.** Using Lagrange's interpolation formula, we have

$$\begin{aligned}
 L_3(x) &= \frac{(x - x_1)(x - x_2)(x - x_3)}{(x_0 - x_1)(x_1 - x_2)(x_0 - x_3)} \cdot y_0 + \frac{(x - x_0)(x - x_2)(x - x_3)}{(x_1 - x_0)(x_1 - x_2)(x_1 - x_3)} \cdot y_1 \\
 &\quad + \frac{(x - x_0)(x - x_1)(x - x_3)}{(x_2 - x_0)(x_2 - x_1)(x_2 - x_3)} \cdot y_2 + \frac{(x - x_0)(x - x_1)(x - x_2)}{(x_3 - x_0)(x_3 - x_1)(x_3 - x_2)} \cdot y_3 \\
 &= \frac{(x - 0)(x - 1)(x - 2)}{(-1 - 0)(-1 - 1)(-1 - 2)} \cdot 1 + \frac{(x + 1)(x - 1)(x - 2)}{(0 + 1)(0 - 1)(0 - 2)} \cdot 1 \\
 &\quad + \frac{(x + 1)(x - 0)(x - 2)}{(1 + 1)(1 - 0)(1 - 2)} \cdot 1 + \frac{(x + 1)(x - 0)(x - 1)}{(2 + 1)(2 - 0)(2 - 1)} (-3) \\
 &= \frac{1}{3}(-2x^3 + 2x + 3).
 \end{aligned}$$

Hence the required polynomial is

$$\frac{1}{3}(-2x^3 + 2x + 3)$$

### 3.6. Newton's divided difference interpolation.

The Lagrange's interpolation formula has the disadvantage that whenever a new data is added to an existing set, then the interpolating polynomial has to be completely recomputed. In this section, we describe Newton's general interpolation formula based on divided difference to overcome the above disadvantage.

Let  $y = f(x)$  be a real valued function defined in  $[a, b]$  and known at  $(n+1)$  distinct arguments  $x_0, x_1, x_2, \dots, x_n$  not in order in any way. We seek a polynomial  $p(x)$  of degree not greater than  $n$  such that

$$y_i \equiv f(x_i) \equiv p(x_i), \quad i = 0, 1, 2, \dots, n \quad \dots \quad (34)$$

$$\text{and } f(x) = p(x) + R_{n+1}(x), \quad \dots \quad (35)$$

$R_{n+1}(x)$  being the remainder or error in interpolation of  $f(x)$ .

From the definition of divided difference, we have

$$f[x, x_0] = \frac{f(x) - f(x_0)}{x - x_0}$$

$$f[x, x_0, x_1] = \frac{f[x, x_0] - f[x_0, x_1]}{x - x_1}$$

$$f[x, x_0, x_1, x_2] = \frac{f[x, x_0, x_1] - f[x_0, x_1, x_2]}{x - x_2}$$

...

...

...

$$f[x, x_0, x_1, x_2, \dots, x_n] = \frac{f[x, x_0, x_1, \dots, x_{n-1}] - f[x_0, x_1, x_2, \dots, x_n]}{x - x_n}$$

Multiplying the above  $(n+1)$  relations successively by

$$(x-x_0), (x-x_0)(x-x_1), (x-x_0)(x-x_1)(x-x_2), \dots (x-x_0)(x-x_1)\dots(x-x_n)$$

and then adding we get the following identity which holds for all values of  $x$  except possibly at  $x = x_i$  ( $i = 0, 1, 2, \dots, n$ ):

$$\begin{aligned} f(x) &= f(x_0) + (x-x_0)f[x_0, x_1] + (x-x_0)(x-x_1)f[x_0, x_1, x_2] + \\ &\quad \dots + (x-x_0)(x-x_1)\dots(x-x_{n-1})f[x_0, x_1, x_2, \dots, x_{n-1}] \\ &\quad + (x-x_0)(x-x_1)\dots(x-x_n)f[x, x_0, x_1, \dots, x_n] \\ &= p(x) + R_{n+1}(x) \end{aligned} \quad \dots \quad (36)$$

where

$$\begin{aligned} p(x) &= f(x_0) + (x-x_0)f[x_0, x_1] + (x-x_0)(x-x_1)f[x_0, x_1, x_2] + \\ &\quad \dots + (x-x_0)(x-x_1)(x-x_2)\dots(x-x_{n-1})f[x_0, x_1, x_2, \dots, x_n] \end{aligned}$$

and

$$R_{n+1}(x) = (x-x_0)(x-x_1)\dots(x-x_n)f[x, x_0, x_1, \dots, x_n]$$

It can be easily verify that

$$f(x_i) = p(x_i) \quad \forall i, \quad i = 0, 1, 2, \dots, n$$

Also, clearly

$$R_{n+1}(x_i) = 0, \text{ for } i = 0, 1, 2, \dots, n$$

Thus  $p(x)$  is the re  
i.e.,

$$f(x) \approx p(x) = f(x_0)$$

$$f[x_0, x_1, x_2] + \dots$$

This formula is 1  
interpolation formula

$$R_{n+1}(x) = (x-x_0)(x-x_1)\dots(x-x_n)$$

**Example.** Apply New  
the polynomial of lo  
conditions  $f(-1) = 21$

**Solution.** Let us first  
table :

$x$	$f(x)$	$f$
-1	-21	
1	15	
2	12	
3	3	

Using the above  
difference formula,

$$\begin{aligned} f(x) &\approx -21 + (x+1) \\ &= x^3 - 9x^2 + \dots \end{aligned}$$

II

**Ex.1.** Given the fo  
using the suitable  
the error

$x$	:
$F(x)$	:

$x_0, x_1, x_2 \dots x_n]$ 

essively by

 $\dots (x-x_1)\dots(x-x_n)$ 

which holds for

 $2, \dots n)$ : $f[x_0, x_1, x_2] +$  $[x_1, x_2, \dots, x_{n-1}]$  $[x_0, x_1, \dots, x_n]$  $\dots (36)$  $f[x_0, x_1, x_2] +$  $[x_1, x_2, \dots, x_n]$  $, \dots, x_n]$ 

## INTERPOLATION

81

Thus  $p(x)$  is the required interpolating polynomial  
i.e.,

$$\begin{aligned} f(x) \approx p(x) = f(x_0) + (x - x_0)f[x_0, x_1] + (x - x_0)(x - x_1) \times \\ f[x_0, x_1, x_2] + \dots + (x - x_0)(x - x_1) \dots (x - x_{n-1}) \times \\ f[x_0, x_1, x_2, \dots, x_n] \quad \dots \quad (37) \end{aligned}$$

This formula is known as Newton's divided difference interpolation formula with remainder or error as

$$R_{n+1}(x) = (x - x_0)(x - x_1) \dots (x - x_n)f[x, x_0, x_1, \dots, x_n] \dots \quad (38)$$

**Example.** Apply Newton's divided difference formula to find the polynomial of lowest possible degree which satisfies the conditions  $f(-1) = 21$ ,  $f(1) = 15$ ,  $f(2) = 12$ ,  $f(3) = 3$

**Solution.** Let us first construct the following divided difference table :

$x$	$f(x)$	$f[x_0, x_1]$	$f[x_0, x_1, x_2]$	$f[x_0, x_1, x_2, x_3]$
-1	-21			
1	15	18		
2	12	-3	-7	
3	3	-9	-3	1

Using the above table, we have from Newton's divided difference formula,

$$\begin{aligned} f(x) \approx -21 + (x+1) \times 18 + (x+1)(x-1)(-7) + (x+1)(x-1)(x-2) \times 1 \\ = x^3 - 9x^2 + 17x + 6. \end{aligned}$$

## ILLUSTRATIVE EXAMPLES

**Ex.1.** Given the following table of function  $F(x) = \frac{1}{x}$ , find  $\frac{1}{2.72}$  using the suitable interpolation formula. Find an estimate of the error

$x$	:	2.7	2.8	2.9
$F(x)$	:	0.3704	0.3571	0.3448

[W.B.U.T., CS-312, 2008]

**Solution.** The difference table is

$x$	$F(x)$	$\Delta F(x)$	$\Delta^2 F(x)$
2.7	0.3704		
2.8	0.3571	-0.0133	
2.9	0.3448	-0.0123	0.0010

To find  $F(2.72)$ , we use Newton's forward difference interpolation formula

$$F(x) = y_0 + s\Delta y_0 + \frac{s(s-1)}{2!} \Delta^2 y_0 + \dots \quad (1)$$

Here  $x_0 = 2.7$ ,  $h = 0.1$

$$\therefore s = \frac{x - x_0}{h} = \frac{2.72 - 2.7}{0.1} = 0.2$$

$\therefore$  From (1), we get

$$F(2.72) = 0.3704 + 0.2 \times (-0.0133) + \frac{0.2(0.2-1)}{2!} \times 0.0010 \\ = 0.36766$$

$$\text{Thus } \frac{1}{2.72} \approx 0.36766.$$

So the error is

$$\frac{1}{2.72} - 0.36766 \approx -1.3 \times 10^{-6}$$

**Ex.2.** Find the polynomial of the least degree which attains the prescribed values of the given points :

$x$	: 0	1	2	3
$y$	: 3	6	11	18

Hence find  $y$  for  $x = 1.1$

[M.A.K.A.U.T., M(CS)-401, 2014]

## INTERPOLATION

**Solution.** The difference ta

$x$	$y$	$\Delta y$
0	3	3
1	6	5
2	11	7
3	18	

Here  $x_0 = 0$ ,  $h = 1$  so th

$\therefore$  From, Newton's forwa

$$y = y_0 + s\Delta y_0$$

we have

$$y = 3 + x \times 3 + \frac{x(x-1)}{2!} \\ = x^2 + 2x + 3$$

So the required polynom

$$y = x^2 + 2x + 3$$

$$\therefore y(1.1) = (1.1)^2 + 2 \times 1.1 + 3$$

**Ex.3.** What is the lowest following value?

$x$	:	0	1	2
$f(x)$	:	1	4	9

**Solution.** The forward

$x$	$y = f(x)$	$\Delta y$
0	1	3
1	4	5
2	9	7
3	16	9
4	25	11
5	36	

**Solution.** The difference table is

$x$	$y$	$\Delta y$	$\Delta^2 y$	$\Delta^3 y$
0	3			
1	6	3		
2	11	5	2	
3	18	7	0	

Here  $x_0 = 0$ ,  $h = 1$  so that  $s = \frac{x - x_0}{h} = \frac{x - 0}{1} = x$

∴ From, Newton's forward difference interpolation formula,

$$y \approx y_0 + s\Delta y_0 + \frac{s(s-1)}{2!} \Delta^2 y_0 + \dots, \quad (1)$$

we have

$$\begin{aligned} y &\approx 3 + x \times 3 + \frac{x(x-1)}{2!} \times 2 + 0 \\ &= x^2 + 2x + 3 \end{aligned}$$

So the required polynomial is

$$y = x^2 + 2x + 3$$

$$\therefore y(1.1) = (1.1)^2 + 2 \times 1.1 + 3 = 6.41$$

**Ex.3.** What is the lowest degree polynomial which takes the following value?

$x$ :	0	1	2	3	4	5
$f(x)$ :	1	4	9	16	25	36

[W.B.U.T., CS-312, 2007]

**Solution.** The forward difference table is

$x$	$y = f(x)$	$\Delta y$	$\Delta^2 y$
0	1		
1	4	3	
2	9	5	2
3	16	7	2
4	25	9	2
5	36	11	

Choose  $x_0 = 0$

$$\therefore s = \frac{x - x_0}{h} = \frac{x - 0}{1} = x$$

$\therefore$  From Newton's forward difference interpolation formula

$$f(x) = y_0 + s\Delta y_0 + \frac{s(s-1)}{2} \Delta^2 y_0 + \dots$$

we have

$$\begin{aligned} f(x) &= 1 + x \times 3 + \frac{x(x-1)}{2} \times 2 \\ &= 1 + 3x + x^2 - x \\ &= 1 + 2x + x^2 \end{aligned}$$

**Ex.4.** Compute the value of  $f(3.5)$  and  $f(7.5)$  using Newton's interpolation from the following table:

$x$	:	3	4	5	6	7	8
$f(x)$	:	27	64	125	216	343	512

[W.B.U.T., CS-312, 2008]

**Solution.** First we construct the difference table as given below:

$x$	$y = f(x)$	$\Delta y$	$\Delta^2 y$	$\Delta^3 y$
3	27	37		
4	64	61	24	
5	125	91	30	6
6	216	127	36	6
7	343	168	42	6
8	512			

To compute  $f(3.5)$ , we choose  $x_0 = 3$

Here  $h = 1$

$$\therefore s = \frac{x - x_0}{h} = \frac{3.5 - 3}{1} = 0.5$$

## INTERPOLATION

$\therefore$  By Newton's forward

$$\begin{aligned} f(3.5) &= 27 + 0.5 \times 37 + \dots \\ &= 42.875 \end{aligned}$$

To compute  $f(7.5)$ , we

$$\therefore s = \frac{x - x_n}{n} = 0.5$$

$\therefore$  By Newton's backward

$$f(x) = y_n +$$

we get

$$f(7.5) = 343 + 0.5 \times 1$$

$$= 424.125$$

**Ex.5.** If  $y(10) = 35.3$ ,  $y(30) = 23.2$ , and  $y(35) = 20.6$  find the value of  $y(20)$  by forward interpolation formula.

**Solution.** The difference table is as follows:

$x$	$y$	$\Delta y$
10	35.3	-2.9
15	32.4	-3.2
20	29.2	-3.1
25	26.1	-2.9
30	23.2	-2.7
35	20.6	-2.7

$\therefore$  By Newton's forward interpolation formula

$$f(3.5) = 27 + 0.5 \times 37 + \frac{0.5(0.5-1)}{2} \times 24 + \frac{0.5(0.5-1)(0.5-2)}{6} \times 6 \\ = 42.875$$

To compute  $f(7.5)$ , we choose  $x_n = 7$

$$\therefore s = \frac{x - x_n}{n} = 0.5$$

$\therefore$  By Newton's backward difference interpolation formula

$$f(x) = y_n + s \nabla y_n + \frac{s(s+1)}{2} \nabla^2 y_n + \dots,$$

we get

$$f(7.5) = 343 + 0.5 \times 127 + \frac{0.5(0.5+1)}{2} \\ \times 42 + \frac{0.5(0.5+1)(0.5+2)}{6} \times 6 \\ = 424.125.$$

Ex.5. If  $y(10) = 35.3$ ,  $y(15) = 32.4$ ,  $y(20) = 29.2$ ,  $y(25) = 26.1$ ,  $y(30) = 23.2$ , and  $y(35) = 20.5$ , find  $y(12)$  using Newton's forward interpolation formula. [W.B.U.T., M(CS)-301, 2009]

**Solution.** The difference table is

$x$	$y$	$\Delta y$	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$	$\Delta^5 y$
10	35.3	-	-	-	-	-
15	32.4	-2.9	-0.3	0.4	-0.3	0.2
20	29.2	-3.2	0.1	0.1	-0.1	-
25	26.1	-3.1	0.2	0.0	-	-
30	23.2	-2.9	0.2	-	-	-
35	20.5	-2.7	-	-	-	-

To find  $y(12)$ , we choose  $x_0 = 10$

Here  $n = 12, h = 5$

$$\therefore s = \frac{x - x_0}{h} = \frac{12 - 10}{5} = 0.4$$

$\therefore$  From Newton's forward difference interpolation formula,

$$y(x) = y_0 + s\Delta y_0 + \frac{s(s-1)}{2!} \Delta^2 y_0 + \dots$$

we have

$$\begin{aligned} y(12) &= 35.3 + 0.4(-29) + \frac{0.4(0.4-1)}{2!} \times (-0.3) \\ &\quad + \frac{0.4(0.4-1)(0.4-2)}{3!} \times (0.4) \\ &\quad + \frac{0.4(0.4-1)(0.4-2)(0.4-3)}{4!} \times (-0.3) = 34.21408 \end{aligned}$$

**Ex.6.** Values of  $x$  (in degree) and  $\sin x$  are given in the following table :

$x$ (in degree):	15	20	25	30
$y = f(x)$	0.2588190	0.3420201	0.4226183	.05
			35	40
			0.5735764	0.6427876

Determine the value of  $\sin 38^\circ$  by Newton's backward difference interpolation formula. [W.B.U.T., CS-312, 2010]

**Solution.** The difference table :

$x$	$y = f(x)$	$\Delta y$	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$
15	0.2588190	0.0832011			
20	0.3420201	0.0805982	-0.0026029	-0.0006136	-0.0000248
25	0.4226183	0.0773817	-0.0032165	-0.0005888	
30	0.5	0.0735764	-0.0038053	-0.0000289	
35	0.5735764	0.0692112	-0.0043652	-0.0005599	
40	0.6427876				

## INTERPOLATION

To find  $\sin 38^\circ$ , we

Here  $h = 5, x = 38$

$$\therefore s = \frac{x - x_n}{h} = \frac{38 - 35}{5} = 0.6$$

So the Newton's I

$$f(x) \approx y_0 + s\Delta y_0 + \frac{s(s-1)}{2!} \Delta^2 y_0 + \dots$$

gives

$$f(38) \approx 0.6427876 -$$

$$+ \frac{(-0.4)}{3!} \times (0.4)$$

$$= 0.61566277$$

$$\therefore \sin 38 \approx 0.615663$$

**Ex.7.** Using approx  
the following table

$x$ :	0.20	0.22
$f(x)$ :	1.6596	1.6600

**Solution.** First we

$x$
0.20
0.22
0.24
0.26
0.28
0.30

Here we apply  
formula for finding

For that we take

$$\therefore s = \frac{x - x_n}{h}$$

To find  $\sin 38^0$ , we choose  $x_n = 40$

Here  $h = 5, x = 38$

$$\therefore s = \frac{x - x_n}{h} = -0.4$$

So the Newton's backward difference formula

$$f(x) \approx y_n + s \nabla y_n + \frac{s(s+1)}{2!} \nabla^2 y_n + \dots$$

gives

$$\begin{aligned} f(38) &\approx 0.6427876 - 0.4 \times 0.0692112 + \frac{(-0.4)(-0.4+1)}{2!} (-0.0043652) \\ &\quad + \frac{(-0.4)(-0.4+1)(-0.4+2)}{3!} (-0.005599) \\ &\quad + \frac{(-0.4)(-0.4+1)(-0.4+2)(-0.4+3)}{4!} (-0.0000289) \\ &= 0.615662777 \end{aligned}$$

$\therefore \sin 38 \approx 0.615663$ , correct upto six decimal places.

Ex.7. Using approximate formula find  $f(0.23)$  and  $f(0.29)$  from the following table [M.A.K.A.U.T., 2013, 2015, 2016]

$x$	0.20	0.22	0.24	0.26	0.28	0.30
$f(x)$	1.6596	1.6698	1.6804	1.6912	1.7024	1.7139

**Solution.** First we construct the difference table as given below:

$x$	$y$	$\Delta y$	$\Delta^2 y$
0.20	1.6596	0.0102	0.0001
0.22	1.6698	0.0106	0.0002
0.24	1.6804	0.0108	0.0004
0.26	1.6912	0.0112	0.0003
0.28	1.7024	0.0115	
0.30	1.7139		

Here we apply Newton's backward difference interpolation formula for finding  $f(0.29)$ .

For that we take  $x_n = 0.30$  as  $x = 0.29$

$$\therefore s = \frac{x - x_n}{h} = \frac{0.29 - 0.30}{0.02} = -0.5$$

Then using Newton's backward formula

$$f(x) = y_n + s \nabla y_n + \frac{s(s+1)}{2!} \nabla^2 y_n + \dots,$$

we get

$$\begin{aligned} f(0.29) &\approx 1.7139 + (-0.5) \times 0.0115 + \frac{(-0.5)(-0.5+1)}{2!} \times 0.0003 \\ &= 1.70777 \\ &\approx 1.7078, \text{ correct upto four decimal places.} \end{aligned}$$

To find  $f(0.23)$ , we choose  $x = 0.23$ ,  $x_0 = 0.22$

$$\therefore h = \frac{x - x_0}{h} = 0.5$$

$\therefore$  By Newton's forward interpolation formula

$$f(x) = y_0 + s \Delta y_0 + s \frac{(s-1)}{2!} \Delta^2 y_0 + \dots$$

we get

$$\begin{aligned} f(0.23) &\approx 1.6698 + 0.5 \times 0.0106 + \frac{0.5(0.5-1)}{2!} \times 0.0001 \\ &= 1.675087 \\ &\approx 1.6751, \text{ correct upto four decimal places.} \end{aligned}$$

**Ex.8.** The function  $y = \sin x$  is tabulated as given below :

$x$	:	0	$\frac{\pi}{4}$	$\frac{\pi}{2}$
$\sin x$	:	0	0.70711	1.0

Find the value of  $\sin \frac{\pi}{3}$  using Lagrange's interpolation formula correct upto 5 places of decimal. [W.B.U.T., C.S-312, 2004]

**Solution.** Using Lagrange's interpolation formula, we obtain,

$$\begin{aligned} L_n(x) &= \frac{\left(x - \frac{\pi}{4}\right)\left(x - \frac{\pi}{2}\right)}{\left(0 - \frac{\pi}{4}\right)\left(0 - \frac{\pi}{2}\right)} \times 0 + \frac{(x-0)\left(x - \frac{\pi}{2}\right)}{\left(\frac{\pi}{4}-0\right)\left(\frac{\pi}{4}-\frac{\pi}{2}\right)} \times 0.70711 \\ &\quad + \frac{(x-0)\left(x - \frac{\pi}{4}\right)}{\left(\frac{\pi}{2}-0\right)\left(\frac{\pi}{2}-\frac{\pi}{4}\right)} \times 1 \\ &= -x\left(x - \frac{\pi}{2}\right) \cdot \frac{16 \times 0.70711}{\pi^2} + \frac{16x}{\pi^2} \left(x - \frac{\pi}{4}\right) \end{aligned}$$

INTERPOLATION

$$\therefore \sin x \approx \frac{8x}{\pi^2}$$

$$\therefore \sin \frac{\pi}{3} \approx \frac{8 \cdot \frac{\pi}{3}}{3\pi^2}$$

$$= 0.8$$

$$\approx 0.8$$

**Ex.9.** Construct the following d

$x$	:	...
$y = f(x)$	:	...

**Solution.** Using we have

$$L_n(x) = \frac{(...)}{(40)}$$

$$= 2.7$$

**Ex.10.** Find the the given data

$x$	:	...
$f(x)$	:	...

$$\therefore \sin x \approx \frac{8x}{\pi^2} (-0.41422x + 0.45711\pi)$$

$$\therefore \sin \frac{\pi}{3} \approx \frac{8 \cdot \pi}{3 \cdot \pi^2} \left( -0.41422 \frac{\pi}{3} + 0.45711\pi \right) \\ = 0.850764$$

$\approx 0.85076$ , correct upto 5 places of decimal.

**Ex.9.** Construct Lagrange's interpolation polynomial by using the following data :

$x$	40	45	50	55
$y = f(x)$	15.22	13.99	12.62	11.13

[W.B.U.T., CS-312, 2007]

**Solution.** Using Lagrange's interpolation formula, we have

$$L_n(x) = \frac{(x-45)(x-50)(x-55)}{(40-45)(40-50)(40-55)} \times 15.22 \\ + \frac{(x-40)(x-50)(x-55)}{(45-40)(45-50)(45-55)} \times 13.99 \\ + \frac{(x-40)(x-45)(x-55)}{(50-40)(50-45)(50-55)} \times 12.62 \\ + \frac{(x-40)(x-45)(x-50)}{(55-40)(55-45)(55-50)} \times 11.13 \\ = 2.7 \times 10^{-5} x^3 - 6.4 \times 10^{-3} x^2 + 15.3 \times 10^{-2} x + 17.62$$

**Ex.10.** Find the polynomial  $f(x)$  and hence calculate  $f(5.5)$  for the given data :

$x$	0	2	3	5	7
$f(x)$	1	47	97	251	477

[W.B.U.T., CS-312, 2006, 2008,  
M(CS)-401, 2016, M(CS)-301, 2015]

**Solution.** Applying Lagrange's interpolation formula, we have

$$\begin{aligned}
 L_n(x) &= \frac{(x-2)(x-3)(x-5)(x-7)}{(0-2)(0-3)(0-5)(0-7)} \times 1 \\
 &\quad + \frac{(x-0)(x-3)(x-5)(x-7)}{(2-0)(2-3)(2-5)(2-7)} \times 47 \\
 &\quad + \frac{(x-0)(x-2)(x-5)(x-7)}{(3-0)(3-2)(3-5)(3-7)} \times 97 \\
 &\quad + \frac{(x-0)(x-2)(x-3)(x-7)}{(5-0)(5-2)(5-3)(5-7)} \times 251 \\
 &\quad + \frac{(x-0)(x-2)(x-3)(x-5)}{(7-0)(7-2)(7-3)(7-5)} \times 477 \\
 &= \frac{(x-2)(x-3)(x-5)(x-7)}{210} + \frac{x(x-3)(x-5)(x-7)}{-30} \\
 &\quad + \frac{x(x-2)(x-5)(x-7)}{24} \times 97 + \frac{x(x-2)(x-3)(x-7)}{-60} \times 251 \\
 &\quad + \frac{x(x-2)(x-3)(x-5)}{280} \times 477
 \end{aligned}$$

$$\therefore f(x) \approx 9x^2 + 5x + 1$$

$$\therefore f(5.5) \approx 9(5.5)^2 + 5 \times 5.5 + 1 = 300.75$$

**Ex.11.** Use Lagrange's interpolation formula to find the value of  $f(x)$  for  $x=0$ , given

$x$	:	-1	-2	2	4
$f(x)$	:	-1	-9	11	69

[W.B.U.T.,MCS-301, 2007]

**Solution.** Applying Lagrange's interpolation formula, we have

$$\begin{aligned}
 f(x) &= \frac{(x+2)(x-2)(x-4)}{(-1+2)(-1-2)(-1-4)} \times (-1) + \frac{(x+1)(x-2)(x-4)}{(-2+1)(-2-2)(-2-4)} \times (-9) \\
 &\quad + \frac{(x+1)(x+2)(x-4)}{(2+1)(2+2)(2-4)} \times 11 + \frac{(x+1)(x+2)(x-2)}{(4+1)(4+2)(4-2)} \times 69
 \end{aligned}$$

INTERPOLATION

$$\therefore f(0) =$$

$$+ \frac{(0+1)(0-2)(0-4)}{3 \times 1 \times (-5)} \times (-9)$$

$$= \frac{16}{15} + 2 +$$

**Ex.12.** Find the value of  $y$  through the following data:

$x$	:
$y$	:

Use it to

**Solution.**

$$y = f(x) =$$

$$= 2(x^2)$$

$$= 2x^2$$

$$\therefore y(15) =$$

$$\text{Now } \frac{dy}{dx}$$

$$\therefore \left( \frac{dy}{dx} \right)$$

$$\text{Also } \int y^3 dx$$

$$\begin{aligned}\therefore f(0) &= \frac{(0+2)(0-2)(0-4)}{1 \times (-3) \times (-5)} \times (-1) + \frac{(0+1)(0-2)(0-4)}{(-1) \times (-4) \times (-6)} \times (-9) \\ &\quad + \frac{(0+1)(0+2)(0-4)}{3 \times 4 \times (-2)} \times 11 + \frac{(0+1)(0+2)(0-2)}{5 \times 6 \times 2} \times 69 \\ &= \frac{16}{15} + 2 + \frac{11}{3} - \frac{23}{5} = 1\end{aligned}$$

**Ex.12.** Find Lagrange's interpolation polynomial passing through the set of points

$x$	:	0	1	2
$y$	:	4	3	6

Use it to find  $y$  at  $x = 1.5$ ,  $\frac{dy}{dx}$  at  $x = 0.5$  and evaluate  $\int_0^3 y dx$ .

[W.B.U.T., MCS-301, 2008]

**Solution.** Using Lagrange's interpolation formula, we have

$$\begin{aligned}y = f(x) &= \frac{(x-1)(x-2)}{(0-1)(0-2)} \times 4 + \frac{(x-0)(x-2)}{(1-0)(1-2)} \times 3 + \frac{(x-0)(x-1)}{(2-0)(2-1)} \times 6 \\ &= 2(x^2 - 3x + 2) - 3(x^2 - 2x) + 3(x^2 - x) \\ &= 2x^2 - 3x + 4 \\ \therefore y(15) &= 2(15)^2 - 3 \times 15 + 4 = 4\end{aligned}$$

Now  $\frac{dy}{dx} = 4x - 3$

$$\therefore \left(\frac{dy}{dx}\right)_{x=0.5} = 4 \times 0.5 - 3 = -1$$

$$\begin{aligned}\text{Also } \int_0^3 y dx &= \int_0^3 (2x^2 - 3x + 4) dx \\ &= \left[ \frac{2x^3}{3} - \frac{3x^2}{2} + 4x \right]_0^3 = 16.5.\end{aligned}$$

**Ex.13.** Apply Lagrange's interpolation formula to find  $f(x)$ , if  $f(1)=2$ ,  $f(2)=4$ ,  $f(3)=8$ ,  $f(4)=16$  and  $f(7)=128$ .

[W.B.U.T., M(CS)-401,2006]

**Solution.** Apply Lagrange's interpolation formula, we have

$$\begin{aligned}
 f(x) &= \frac{(x-2)(x-3)(x-4)(x-7)}{(1-2)(1-3)(1-4)(1-7)} \times 2 \\
 &\quad + \frac{(x-1)(x-3)(x-4)(x-7)}{(2-1)(2-3)(2-4)(2-7)} \times 4 \\
 &\quad + \frac{(x-1)(x-2)(x-4)(x-7)}{(3-1)(3-2)(3-4)(3-7)} \times 8 \\
 &\quad + \frac{(x-1)(x-2)(x-3)(x-7)}{(4-1)(4-2)(4-3)(4-7)} \times 16 \\
 &\quad + \frac{(x-1)(x-2)(x-3)(x-4)}{(7-1)(7-2)(7-3)(7-4)} \times 128 \\
 &= \frac{1}{18} (x^4 - 16x^3 + 89x^2 - 206x + 168) \\
 &\quad - \frac{2}{5} (x^4 - 15x^3 + 31x^2 - 101x + 84) \\
 &\quad + (x^4 - 14x^3 + 63x^2 - 106x + 56) \\
 &\quad - \frac{8}{9} (x^4 - 13x^3 + 53x^2 - 83x + 42) \\
 &\quad + \frac{16}{45} (x^4 - 10x^3 + 35x^2 - 50x + 24) \\
 &= 0.1222x^4 - 0.8889x^3 + 20.8778x^2 - 21.0444x + 2.9333
 \end{aligned}$$

**Ex.14.** Use Newton's divided difference formula to find  $f(5)$  from the following data :

$x$	0	2	3	4	7	8
$f(x)$	4	26	58	112	466	668

[W.B.U.T. CS-312, 2009,  
M.A.KAUT, M(CS)-401, 2016, M(CS)-301, 2014]

**Solution.** The

$x$	$f(x)$
0	4
2	26
3	58
4	112
7	466
8	668

Using New

$$f(x) \approx f(x_0) +$$

we get

$$f(5) \approx 4 + (5 -$$

$$= 194.$$

**Ex.15.** Find

through the

Hence find

**Solution.** H

$$f(x) \approx f(x_0) +$$

The divid

$x$	$f(x)$
4	-4
7	8
9	32
12	10

to find  $f(x)$ , if  
128.  
[CS)-401,2006]  
nula, we have

**Solution.** The divided difference table is given below :

$x$	$f(x)$	1st div.	2nd div.	3rd div.	4th div.
0	4				
2	26	11			
3	58		7		
4	112			1	
7	466				0
8	668				0

Using Newton's divided difference interpolation formula

$f(x) \approx f(x_0) + (x - x_0)f[x_0, x_1] + (x - x_0)(x - x_1)f[x_0, x_1, x_2] + \dots$ ,  
we get

$$f(5) \approx 4 + (5 - 0) \times 11 + (5 - 0)(5 - 2) \times 7 + (5 - 0)(5 - 2)(5 - 3) \times 1 \\ = 194.$$

**Ex.15.** Find the equation of the cubic curve which passes through the points  $(4, -43), (7, 83), (9, 327)$  and  $(12, 1053)$   
Hence find  $f(10)$

**Solution.** Here we use Newton's divided difference formula,  
 $f(x) \approx f(x_0) + (x - x_0)f[x_0, x_1] + (x - x_0)(x - x_1)f[x_0, x_1, x_2] + \dots$  (1)

The divided difference table is

$x$	$f(x)$	$f[x_0, x_1]$	$f[x_0, x_1, x_2]$	$f[x_0, x_1, x_2, x_3]$
4	-43			
7	83	42		
9	327		16	
12	1053			1

From (1), we get

$$\begin{aligned} f(x) &\approx -43 + (x-4) \times 42 + (x-4)(x-7) \times 16 + (x-4)(x-7)(x-9) \times 1 \\ &= x^3 - 4x^2 - 7x - 15 \\ \therefore f(10) &= 10^3 - 4 \times 10^2 - 7 \times 10 - 15 \\ &= 515 \end{aligned}$$

**Ex.16.** Using Newton's forward formula compute  $y_{12}$  given that

$$y_{10} = 600, y_{20} = 512, y_{30} = 439, y_{40} = 346, y_{50} = 243$$

**Solution.** The forward difference table is

x	y	$\Delta y$	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$
10	600	-88			
20	512	15	-73	-35	
30	439	-20	-93	10	45
40	346	-10			
50	243	-103			

To find  $y_{12}$ , we choose  $x_0 = 10$ , so that

$$s = \frac{x - x_0}{h} = \frac{12 - 10}{10} = 0.2$$

Then Newton's forward difference interpolation formula

$$y \approx y_0 + s\Delta y_0 + \frac{s(s-1)}{2!} \Delta^2 y_0 + \dots$$

gives

$$\begin{aligned} y_{12} &\approx 600 + 0.2 \times (-88) + \frac{0.2(0.2-1)}{2!} \times 15 + \frac{0.2(0.2-1)(0.2-2)}{3!} \times (-35) \\ &\quad + \frac{0.2(0.2-1)(0.2-2)(0.2-3)}{4!} \times 45 \\ &= 578.008 \\ \therefore y_{12} &\approx 578 \end{aligned}$$

**Ex. 17.** Find the four divided difference for the points  $(2, 3), (4, 43), (7, 778), (8, 1515)$

**Solution.** The divided difference table is

x	f(x)	1st div.
2	3	
4	43	
7	778	
8	1515	

Using Newton's di

$$f(x) = f(x_0) + (x - x_0)$$

we get

$$\begin{aligned} f(x) &= 3 + (x-2) \times 15 \\ &= 3 + (20-40) \div 4 \\ &= 13x^3 - 124x^2 + \dots \end{aligned}$$

**Ex.18.** Using Newt

x	y	1st div.

3.6	36.5982	28

**Solution.** The divided difference table is

x	y	1st div.
2.5	12.1825	
2.8	16.4446	14
3.0	20.0855	18
3.1	22.1980	21
3.6	36.5982	28

Ex. 17. Find the fourth degree curve  $y = f(x)$  passing through the points  $(2, 3), (4, 43), (7, 778)$  and  $(8, 1515)$  using Newton's divided difference formula.

[W.B.U.T. MCS-401, 2006]

**Solution.** The divided difference table is

x	f(x)	1st order div. diff.	2nd order div. diff.	3rd order div. diff.
2	3			
4	43	20		
7	778	245	45	
8	1515	737	123	13

Using Newton's divided difference interpolation formula

$$f(x) = f(x_0) + (x - x_0)f(x_0, x_1) + (x - x_0)(x - x_1)f(x_0, x_1, x_2) + \dots$$

we get

$$\begin{aligned} f(x) &= 3 + (x - 2) \times 20 + (x - 2)(x - 4) \times 45 + (x - 2)(x - 4)(x - 7) \times 13 \\ &= 3 + (20 - 40) + 45(x^2 - 6x + 8) + 19(x^3 - 13x^2 + 80x - 56) \\ &= 13x^3 - 124x^2 + 400x - 405 \end{aligned}$$

Ex. 18. Using Newton divide difference formula find  $y(3.4)$ :

x	2.5	2.8	3.0	3.1	3.6
y	12.1825	16.4446	20.0855	22.1980	36.5982

[W.B.U.T. CS-312, 2007]

**Solution.** The divided difference table is

x	y	1st order div. diff	2nd order div. diff.	3rd order div. diff.	4th order div. diff
2.5	12.1825	14.207			
2.8	16.4446	18.2045	7.995	2.9	0.8378
3.0	20.0855	21.125	9.735	3.8216	
3.1	22.1980	28.8004	12.7923		
3.6	36.5982				

Using Newton's divided difference interpolation formula  
 $f(x) = f(x_0) + (x - x_0)/f(x_0, x_1) + (x - x_0)(x - x_1)f(x_0, x_1, x_2),$   
we get,

$$\begin{aligned} f(3.4) &= 121825 + (34 - 25) \times 14207 + (34 - 25)(34 - 28) \times 793 \\ &\quad + (34 - 25)(34 - 28)(34 - 30) \times 2.9 \\ &\quad + (34 - 25)(34 - 28)(34 - 30)(34 - 31) \times 0.837 \\ &= 29.96679 \end{aligned}$$

$\therefore y(3.4) = 29.9668$ , correct upto four decimal places.

**Ex.19.** Calculate  $f(1.135)$  using suitable formula:

$x$	1.140	1.145	1.150	1.155	1.160	1.165
$y$	0.131030	0.13541	0.13976	0.14410	0.14842	0.15272

[W.B.U.T. CS-312, 2007]

**Solution.** The difference table is

$x$	$y = f(x)$	$\Delta y$	$\Delta^2 y$	$\Delta^3 y$
1.140	0.13103		-0.00003	
1.145	0.13541	0.00438	-0.00001	0.00002
1.150	0.13976	0.00435	-0.00002	-0.00001
1.155	0.14410	0.00434	-0.00002	0
1.160	0.14842	0.00432	-0.00002	
1.165	0.15272	0.00430		

To find  $f(1.135)$ , we choose  $x_0 = 1.140$ .  
Here  $h = 0.005$ ,  $x = 1.135$

$$\frac{x - x_0}{h} = \frac{1.135 - 1.140}{0.005} = -1$$

Using Newton's forward difference interpolation formula

$$f(x) = y_0 + x\Delta y_0 + \frac{x(x-1)}{2!} \Delta^2 y_0 + \dots$$

$\Rightarrow$  get

$$\begin{aligned} f(1.135) &= 0.13103 + (-1) \times 0.00438 + \frac{(-1)(-1-1)}{2!} \\ &\quad \times (-0.00003) + \frac{(-1)(-1-1)(-1-2)}{6} \times 0.00002 \\ &= 0.1294 \end{aligned}$$

## I. Solved Examples

1. Fit a polynomial of degree 3 through the following values

$x$	:
$y$	:

Hence find  $y(1)$

2. Find  $f(0.3)$  which points by the method of undetermined coefficients

3. Using Newton's divided difference method fit a polynomial of degree 3 through the points  $(1, 1)$  and  $(2, -3)$ .

4. Find the forward difference table for  $f(x)$  where  $f(0) = 1$

5. Find Newton's divided difference function  $f(x)$  which passes through the points  $(0, 1)$  and  $(1, 2)$

6. Using appropriate values of  $f(b)$  from the following table find  $f(5)$

$x$	:
$f(x)$	:

7. Find  $f(1.02)$  having the following data

$x$	:
$f(x)$	:

8. Evaluate  $f(1)$  given  $x$  and  $f(x)$  as follows

$x$	:
$f(x)$	:

9. Using appropriate values of  $f(b)$  from the following table find  $f(1)$

$x$	:
$f(x)$	:

Interpolation formula  
 $(x - x_1)f(x_0, x, x_2) + \dots$

$$- 2.5)(3.4 - 2.8) \times 7.995 \\ 3.0) \times 2.9$$

$$3.0)(3.4 - 3.1) \times 0.8378$$

decimal places.

formula:

1.160	1.165
0.14842	0.15272

R.U.T. CS-312, 2007]

### Exercise

#### I. SHORT ANSWER QUESTIONS

1. Fit a polynomial of degree three which takes the following values

x :	3	4	5	6
y :	6	24	60	120

Hence find  $y(1)$ .

2. Find  $f(0.3)$  where  $f(x) = 5^x$ , taking 0 and 1 as interpolating points by the methods of interpolation.

3. Using Newton's forward interpolation formula find the polynomial of degree 3 passing through the points  $(-1, 1)$ ,  $(0, 1)$ ,  $(1, 1)$  and  $(2, -3)$ .

4. Find the forward interpolation polynomial for the function  $f(x)$  where  $f(0) = -1$ ,  $f(1) = 1$ ,  $f(2) = 1$  and  $f(3) = -2$ .

5. Find Newton's forward interpolation polynomial of the function  $f(x)$  when  $f(0) = 1$ ,  $f(1) = 2$ ,  $f(2) = 1$  and  $f(3) = 10$

6. Using appropriate interpolation formula, find the value of  $f(5)$  from the following data :

x :	3	4	6	8
$f(x)$ :	4.5	13.2	43.7	56.4

7. Find  $f(1.02)$  having given

x :	1.00	1.10	1.20	1.30
$f(x)$ :	0.8415	0.8912	0.9320	0.9636

8. Evaluate  $f(1)$  from the following values of  $x$  and  $f(x)$ :

x :	0	2	4	6
$f(x)$ :	2	6	10	15

9. Using appropriate interpolation formula, find the value of the function  $f(x)$  when  $x = 7$  from the following data.

x :	2	4	6	8
$f(x)$ :	15	28	56	89

10. Find Newton's backward difference interpolation polynomial against the tabulated values :

$x$ :	3	4	5	6
$y$ :	6	24	60	120

11. Find the value of  $y$  when  $x = 19$ ; given

$x$ :	0	1	20
$y$ :	0	1	2

12. Compute  $f(21)$  using the following data :

$x$ :	0	5	10	20
$f(x)$ :	1.0	1.6	3.8	15.4

13. Use Lagrange's interpolation formula to find the value of  $f(x)$  for  $x = 0$ , given the following table :

$x$ :	-1	-2	2	4
$f(x)$ :	-1	-9	11	69

[W.B.U.T., CS-312, 2007]

14.  $f(x)$  is a function defined on  $[0, 1]$  having values 0, -1 and 0 at  $x = 0, \frac{1}{2}$  and 1. Find the two degree polynomial  $\phi(x) \approx f(x)$  such that  $\phi(0) = f(0), \phi\left(\frac{1}{2}\right) = f\left(\frac{1}{2}\right)$  and  $\phi(1) = f(1)$

15. Find the Lagrangian polynomial for the following tabulated value :

$x$ :	0	1	3
$y$ :	0	3	1

16. Find Lagrange's interpolation polynomial for the function  $f(x)$  when  $f(0) = 4, f(1) = 3, f(2) = 6$

17. Find Lagrange's interpolation polynomial for the function  $f(x) = \sin x\pi$  when  $x_0 = 0, x_1 = \frac{1}{6}, x_2 = \frac{1}{2}$ . Also compute the value of  $\sin \pi/3$ .

18. Find the and  $(3, 55)$  u

19. Using N when  $P(1) =$

20. Given

$x$ :	
$f(x)$ :	

Find  $f(4)$

1.  $x^3 - 3x^2 +$

4.  $-\frac{1}{6}(x^3 + 3$

6. 26.7

10.  $x^3 - 3x^2$

15.  $-\frac{4}{3}x^2 + \frac{1}{$

18.  $y = 8x^2$

I  
1. If  $y(10) = 3$

$y(30) = 23$

Newton's

2. Find  $f(2.5)$   
the given dat

$x$	
$y = f(x)$	

## INTERPOLATION

99

18. Find the parabola passing through the points  $(0, 1)$ ,  $(1, 3)$  and  $(3, 55)$  using Newton's divide interpolation formula.

19. Using Newton's divide interpolation formula, find  $p(4)$  when  $p(1) = 10$ ,  $p(2) = 15$  and  $p(5) = 42$ .

20. Given

$x$	:	1	2	5
$f(x)$	:	10	15	42

Find  $f(4)$

### Answers

1.  $x^3 - 3x^2 + 2x, 0$       2. 2.2      3.  $1 - \frac{2}{3}x(x^2 - 1)$

4.  $-\frac{1}{6}(x^3 + 3x^2 - 16x + 6)$       5.  $2x^3 - 7x^2 + 6x + 1$

6. 26.7      7. 0.8521      8. 4.0625      9. 72.5

10.  $x^3 - 3x^2 + 2x$  12. 17.23      14.  $\phi(x) = 4x^2 - 4x$

15.  $-\frac{4}{3}x^2 + \frac{13}{3}x$       16.  $2x^2 - 3x + 4$       17.  $-3x^2 + \frac{7}{2}x$ , 0.8333

18.  $y = 8x^2 - 6x + 1$       19. 31      20. 31

## II. LONG ANSWER QUESTIONS

1. If  $y(10) = 353$ ,  $y(15) = 324$ ,  $y(20) = 292$ ,  $y(25) = 261$ ,

$y(30) = 23.2$  and  $y(35) = 20.5$ , find  $y(12)$  using  
Newton's forward interpolation formula.

[WBUT, CS-312, 2010]

2. Find  $f(2.5)$  using Newton's forward difference formula for  
the given data:

$x$	:	1	2	3	4	5	6
$y = f(x)$	:	0	1	8	27	64	125

3. A function  $y = f(x)$  is given by the following table. Find  $f(0.2)$  by a suitable formula.

$x$ :	0	1	2	3	4	5	6
$y = f(x)$ :	176	185	194	203	212	220	229

4. Find the value of  $\sqrt{2}$  correct upto four significant figures from the following table:

$x$ :	1.9	2.1	2.3	2.5	2.7
$\sqrt{x}$ :	1.3784	1.4491	1.5166	1.5811	1.6432

5. Calculate  $f(1.135)$  using suitable formula

$x$ :	1.140	1.145	1.150	1.155	1.160	1.165
$f(x)$ :	0.13103	0.13541	0.13976	0.14410	0.14842	0.15272

[W.B.U.T., CS-312, 2007]

6. Compute  $y(0.5)$  using the following table:

$x$ :	0	1	2	3	4	5
$y$ :	5.2	8.0	10.4	12.4	14.0	15.2

7. Determine the polynomial of degree 3 from the following table:

$x$ :	0	1	2	3	4	5
$y$ :	-3	-5	-11	-15	-11	-7

8. Find the equation of the cubic curve that passes through the points  $(0, -5)$ ,  $(1, -10)$ ,  $(2, -9)$ ,  $(3, 4)$  and  $(4, 35)$ .

[W.B.U.T., CS-312, 2004]

9. Compute the values of  $f(3.5)$  and  $f(7.5)$  using Newton's interpolation from the following table:

$x$ :	3	4	5	6	7	8
$f(x)$ :	27	64	125	216	343	512

[W.B.U.T., CS-312, 2008]

10. The values of  $y = \sin x$  are given below for different values of  $x$ . Find the values of  $y$  for (i)  $x = 32^\circ$ , (ii)  $x = 52^\circ$ .

$x$ :	$30^\circ$	$35^\circ$	$40^\circ$	$45^\circ$	$50^\circ$	$55^\circ$
$y = \sin x$ :	0.5000	0.5735	0.6428	0.7071	0.7660	0.8192

## INTERPOLATION

11. Using appropriate

$x$  : 0.20

$f(x)$  : 1.659

12. The population

year : 1985

population : 4

(in lacs)

Using suitable  
for the year 1985

13. Apply Lagrange

$f(1) = 2, f(2) = 4, f$

14. Use Lagrange  
the following data

$x$  :

$y$  :

15. Find the fourth  
points  $(2, 3), (4,$   
divided difference

16. Using Newton

$x$  : 2.5

$y$  : 12.1825

17. Using divide  
 $f(27)$  from the fo

$x$  :

$f(x)$  :

able. Find

11. Using appropriate formula find  $f(0.29)$  from the following table:

$x$	0.20	0.22	0.24	0.26	0.28	0.30
$f(x)$	1.6596	1.6698	1.6804	1.6912	1.7024	1.7139

12. The population of a city for five census are given below:

year	:	1941	1951	1961	1971	1981	1991
population	:	46.52	66.23	81.01	93.70	101.58	120.92 (in lacs)

Using suitable formula estimate the population of the city for the year 1985

13. Apply Lagrange's interpolation formula to find  $f(x)$ , if  $f(1) = 2, f(2) = 4, f(3) = 8, f(4) = 16$  and  $f(7) = 128$ .

[W.B.U.T., CS-312, 2006, 2010]

14. Use Lagrange's interpolation formula to fit a polynomial to the following data. Hence find  $y(4)$

$x$	:	-1	0	2	3
$y$	:	-8	3	1	2

15. Find the fourth degree curve  $y = f(x)$  passing through the points  $(2, 3), (4, 43), (7, 778)$  and  $(8, 1515)$ , using Newton's divided difference formula. [W.B.U.T., CS-312, 2006]

16. Using Newton's divided difference formula to find  $y(3.4)$

$x$ :	2.5	2.8	3.0	3.1	3.6
$y$ :	12.1825	16.4446	20.0855	22.1980	36.5982

[W.B.U.T., CS-312, 2007]

17. Using divided difference interpolation formula, compute  $f(27)$  from the following data:

$x$	:	14	17	31	35
$f(x)$	:	68.7	64.0	44.0	39.1

18. Find  $f(8)$  using Newton's divided difference formula given that

$x :$	4	5	7	10	11	13
$f(x) :$	48	100	294	900	1210	2028

19. Use Newton's divided difference formula to approximate  $f(0.05)$  from the following table

$x :$	0.0	0.2	0.4	0.6	0.8
$f(x) :$	1.0000	1.22140	1.49182	1.82212	2.22554

[W.B.U.T., CS-312, 2002]

20. Find the values of (i)  $\log_{10}(111)$  and  $\log_{10}(17.8)$  from the following table

$x :$	11	12	13	14	15	16	17
$\log_{10}x :$	1.0414	1.0792	1.1139	1.1461	1.1761	1.2041	1.2304

### Answers

### III. MULTIPLE CHOICE QUESTIONS

1. In Newton's forward interpolation, the interval should be
  - equally spaced
  - not equally spaced
  - may be equally spaced
  - both (a) and (b)
2. Newton's forward interpolation formula is used to interpolate
  - near end
  - near central position
  - near beginning
  - none of these

[W.B.U.T., CS-312, 2008, MCS-401, 2014]

### INTERPOLATION

3. The coefficient of Newton's divided difference formula are

$$(a) \frac{s(s-1)\dots(s-n+1)}{n!}$$

$$(c) \frac{s(s-1)\dots(s-n+1)}{(n-1)!}$$

4. In Newton's forward interpolation, if  $s = \frac{x-x_0}{h}$  lies between

$$(a) 1 \text{ and } 2 \quad (b)$$

[M.A.K.A.U.T.]

5. Newton's backward interpolation formula are

$$(a) \text{near end}$$

$$(c) \text{near the beginning}$$

6. The restriction on the interval in Newton's forward and backward interpolation are

$$(a) \text{should not be so large}$$

$$(b) \text{should be in arithmetic progression}$$

$$(c) \text{should be in geometric progression}$$

$$(d) \text{should be in positive ratio}$$

7. The coefficient of Newton's backward interpolation formula are

$$(a) \frac{u(u-1)\dots(u-n+1)}{n!}$$

$$(c) \frac{u(u-1)\dots(u-n+1)}{(n-1)!}$$

8. In Newton's backward interpolation formula, the value of  $s = \frac{x-x_n}{h}$  should be
  - 0 and 1
  - greater than 1

3. The coefficient of Newton's forward difference interpolation formula are

- (a)  $\frac{s(s-1)\dots(s-n+1)}{n!}$       (b)  $\frac{s(s+1)\dots(s+n-1)}{n!}$   
 (c)  $\frac{s(s-1)\dots(s-n+1)}{(n-1)!}$       (d) none of these  
 [where  $s = \frac{x-x_0}{h}$ ]

4. In Newton's forward difference interpolation, the value of  $s = \frac{x-x_0}{h}$  lies between

- (a) 1 and 2      (b) -1 and 1      (c) 0 and  $\infty$       (d) 0 and 1

[M.A.K.A.U.T. M(CS)-301, 2015, M(CS)-401, 2016]

5. Newton's backward interpolation formula is used to interpolate

- (a) near end      (b) near central position  
 (c) near the beginning      (d) none of these

6. The restriction on the interpolating points for Newton's forward and backward formulae is

- (a) should not be so large  
 (b) should be in arithmetic progression  
 (c) should be in geometric progression  
 (d) should be in positive

7. The coefficient of Newton's backward difference interpolation formula are

- (a)  $\frac{u(u-1)\dots(u-n+1)}{n!}$       (b)  $\frac{u(u+1)\dots(u+n-1)}{n!}$   
 (c)  $\frac{u(u-1)\dots(u-n+1)}{(n-1)!}$       (d) none of these  
 [where  $u = \frac{x-x_n}{h}$ ]

8. In Newton's backward difference interpolation formula, the value of  $s = \frac{x-x_n}{h}$  should lie between

- (a) 0 and 1      (b) 0 and  $\infty$   
 (c) greater than 1      (d) no restriction

9. The coefficient in Newton's forward and backward difference formula are

- (a) value of the point of interpolation
- (b) value of the common difference of the values of  $x$
- (c) value of  $x$
- (d) value of  $y$

10. If  $f(3) = 4, f(4) = 13$  and  $f(6) = 43$ , then  $f(5)$  is equal to

- (a) 20
- (b) 26
- (c) 25
- (d) 39

11. If  $f(0) = 12, f(3) = 6$  and  $f(4) = 8$ , then the linear interpolation function  $f(x)$  is

- (a)  $x^2 - 3x + 12$
- (b)  $x^2 - 5x$
- (c)  $x^3 - x^2 - 5x$
- (d)  $x^2 - 5x + 12$

[W.B.U.T., CS-312, 2011]

12. For a given set of values of  $x$  and  $f(x)$ , the interpolation polynomial is

- (a) unique
- (b) not unique
- (c) has degree  $\geq 3$
- (d) none

13. The degree of the interpolation polynomial of a function whose values are known at 8 points is

- (a) 5
- (b) 6
- (c) 7
- (d) 8

14. It cannot be recommended to construct an interpolation polynomial for a function  $f(x)$  if

- (a)  $f(x)$  is not a polynomial
- (b)  $f(x)$  is not derivable some where
- (c)  $f(x)$  has abrupt changes
- (d) graph of  $f(x)$  is unknown.

15. Lagrange's interpolation formula deals with

- (a) Equispaced arguments only
- (b) Unequispaced arguments only
- (c) both (a) and (b)
- (d) none of these

[W.B.U.T., CS-312, 2007, 2008]

M(CS)-301, 2015, M(CS)-401, 2016

## INTERPOLATION

16. The restriction on formula is

- (a) should be unequal
- (b) should be equal
- (c) both
- (d) none

17. If  $y = f(x)$  are known at  $k$  points then the Lagrange's

- (a) atmost  $n$
- (c) exactly  $n$

18. In Lagrange's p

- $y_0, y_1, \dots, y_n$  i.e., the
- (a) 2
- (b) 3

19. The Lagrange's i

$x :$	1
$f(x) :$	4

is

- (a)  $3x^2 - 12$
- (c)  $x^2 - 4$

20. The polynomial  $f(3) = -1, f(4) = 5, f$

- (a)  $2x^2 + 8x + 5$
- (c)  $x^2 + 8x + 5$

21. Geometrically the points of interpolation

- (a) parabola
- (c) circle

22. In Newton's backward interpolation, the interval should be

- (a) equally spaced
- (b) not equally spaced
- (c) may be equally spaced
- (d) both (a) and (b)

[M.A.K.A.U.T., M(CS)-301, 2014]

23. Newton's divided difference interpolation formula is used for

- (a) equispaced arguments only
- (b) unequispaced arguments only
- (c) both equispaced and unequispaced arguments
- (d) none of these.

[M.A.K.A.U.T., M(CS)-301, 2015]

### 4

#### 4.1 Introduction

In this chapter we will learn how to evaluate definite integrals

for any finite interval by using various numerical methods.

with a suitable approximation.

be an approximation, the function value at the endpoints is usually known.

Let  $y = f(x)$  be a function defined on an interval  $I$  such that the values of  $f(x)$  at all points in  $I$  are known. Let us assume that all  $x_i$  lie in  $I$ . Let  $p(x)$  be the polynomial of degree  $n$  such that

$p(x_i) = f(x_i)$  for  $i = 0, 1, 2, \dots, n$ .

Thus  $p(x)$  is called the interpolating polynomial.

If  $I$  is the interval  $[a, b]$ , then

Then the expression

$E = \int_a^b f(x) dx$

is known as the definite integral.

#### 4.2. The Interpolation of a Function

(a) Degree of a Polynomial

A quadratic polynomial is a polynomial of degree 2. A quadrati

$m$  (where  $m$  is being considered).
